R&S® FSH
Handheld Spectrum Analyzer

R&S® FSH3 100 kHz to 3 GHz
R&S® FSH6 100 kHz to 6 GHz
R&S® FSH18 10 MHz to 18 GHz

Fourth Edition March 2007

ROHDE&SCHWARZ

Spectrum analysis anywhere, anytime – on earth and in space

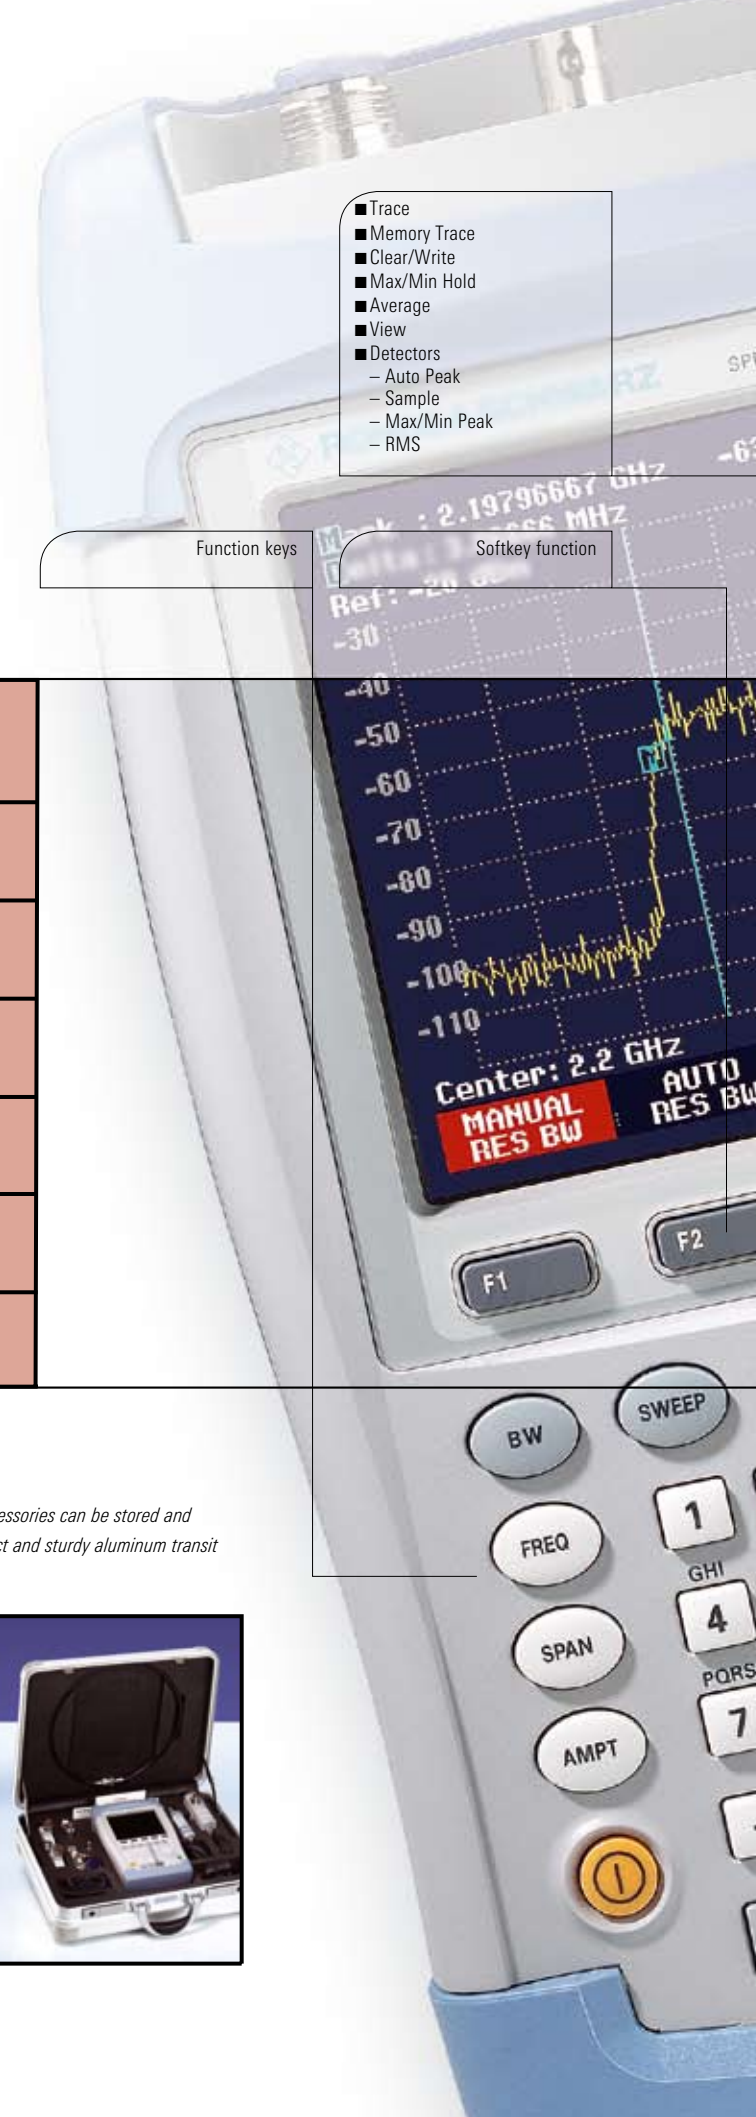
The R&S®FSH is the ideal spectrum analyzer for rapid, high-precision, cost-effective signal investigations. It provides a large number of measurement functions and so can handle anything from the installation or maintenance of a mobile radio base station up to on-site fault location in RF cables as well as development and service – an extensive range of applications.

Due to its excellent characteristics, the R&S®FSH3 is used on board the International Space Station (ISS) for distance-to-fault measurements on RF antenna cables.

Handy, robust, and portable

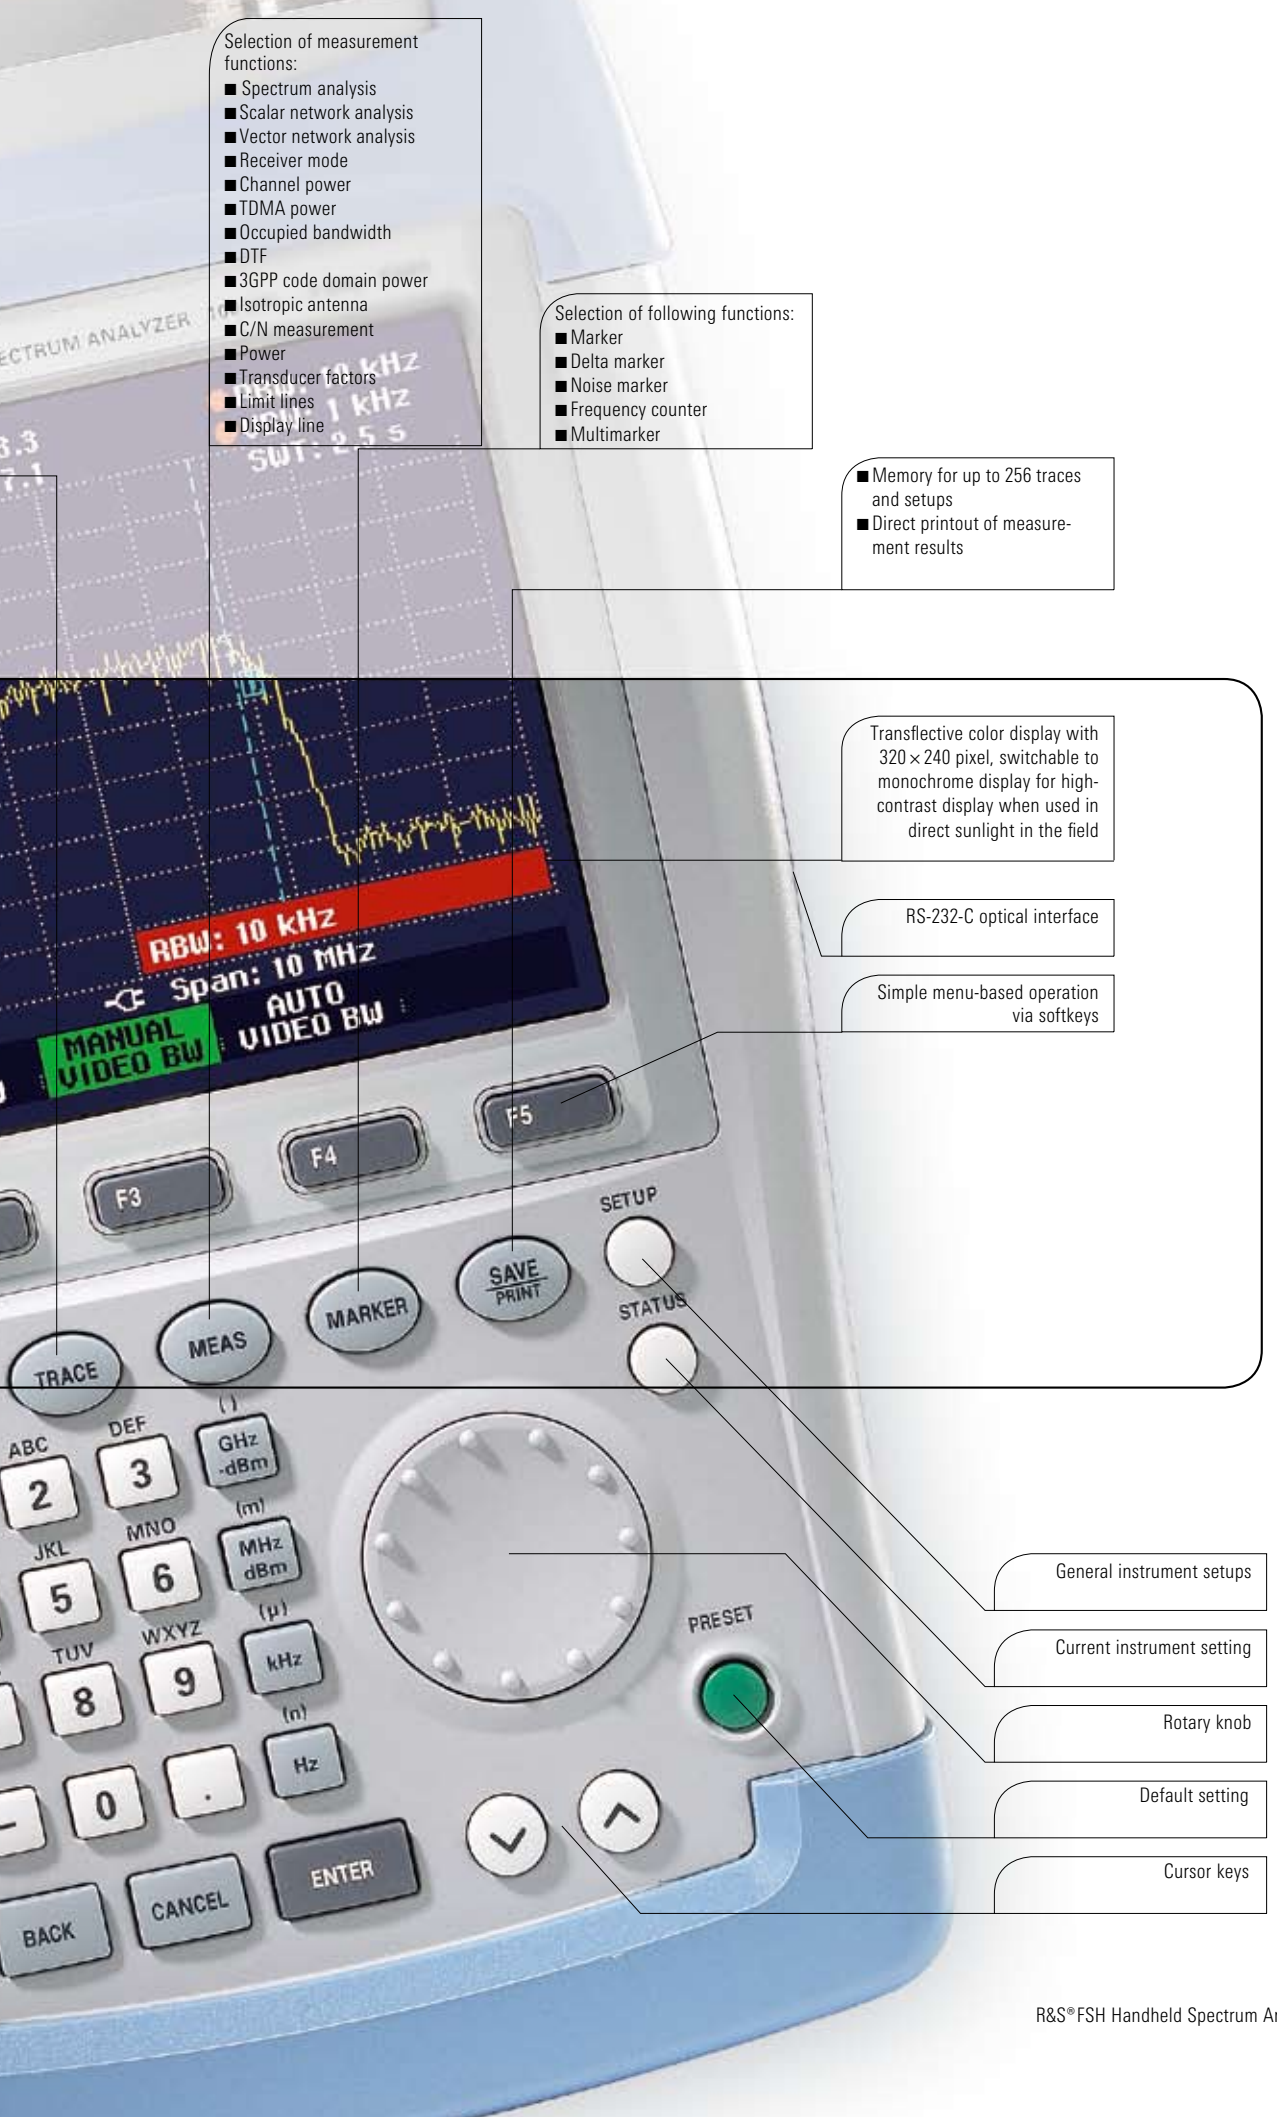
The R&S®FSH has been designed as a robust, portable spectrum analyzer that can be used in the field.

- **Robust edge protection, stable carrying handle**
- **Easy operation**
- **Four hours operating time on battery power**
- **Storage of up to 256 traces and setups**
- **Easy data transfer to PC**
- **High measurement accuracy**
- **Best RF characteristics in its class**



The R&S®FSH can, of course, also be used on the lab bench. The R&S®FSH has an adjustable, fold-out stand to position the instrument to an optimal display viewing angle.

The R&S®FSH and its accessories can be stored and transported in the compact and sturdy aluminum transit case.



Selection of measurement functions:
■ Spectrum analysis
■ Scalar network analysis
■ Vector network analysis
■ Receiver mode
■ Channel power
■ TDMA power
■ Occupied bandwidth
■ DTF
■ 3GPP code domain power
■ Isotropic antenna
■ C/N measurement
■ Power
■ Transducer factors
■ Limit lines
■ Display line
Selection of following functions:
■ Marker
■ Delta marker
■ Noise marker
■ Frequency counter
■ Multimarker
■ Memory for up to 256 traces and setups
■ Direct printout of measurement results
Transflective color display with 320 × 240 pixel, switchable to monochrome display for high-contrast display when used in direct sunlight in the field
RS-232-C optical interface
Simple menu-based operation via softkeys
RBW: 10 kHz
Span: 10 MHz
AUTO VIDEO BW
MANUAL VIDEO BW

Data in brief

	R&S®FSH3	R&S®FSH6	R&S®FSH18
Frequency range	100 kHz to 3 GHz	100 kHz to 6 GHz	10 MHz to 18 GHz
Resolution bandwidths	1 kHz to 1 MHz (model .13) 100 Hz to 1 MHz (models .03 and .23)	100 Hz to 1 MHz	
Video bandwidths	10 Hz to 1 MHz		
Displayed average noise level	typ. –114 dBm (1 kHz) (model .13) typ. –135 dBm (100 Hz) (models .03 and .23)	typ. –135 dBm (100 Hz)	typ. –128 dBm (100 Hz)
TOI	typ. 13 dBm		typ. 7 dBm
SSB phase noise	<–100 dBc (1 Hz) at 100 kHz from carrier		–90 dBc (1 Hz)
Detectors	sample, max/min peak, auto peak, RMS		
Level measurement uncertainty	<1.5 dB, typ. 0.5 dB		<1.5 dB to 6 GHz <2.5 dB to 16 GHz <3 dB to 18 GHz
Reference level	–80 dBm to +20 dBm		
Dimensions	170 mm × 120 mm × 270 mm (6.69 in × 4.72 in × 10.63 in)		
Weight	2.5 kg (5,52 lb)		

R&S®FSH – options and applications

The R&S®FSH can be used for measurements up to an upper frequency limit of 3 GHz, 6 GHz, and 18 GHz. The 3 GHz and 6 GHz are available with or without internal tracking generator. When the tracking generator is included, the R&S®FSH can be used for distance-to-fault (DTF) measurements, scalar and vector network analysis, and one-port cable loss measurement. Almost all models come standard with an adjustable preamplifier, making them suitable for measuring very small signals. Power sensors are available as accessories for high-precision terminating power measurements up to 8 GHz or 18 GHz as well as for directional power measurements up to 4 GHz. The following tables show possible configurations for various applications and an overview of available models.

Product \ Application	TDMA power measurements	Channel-power measurements	Field-strength measurements/ measurements with isotropic antenna	C/N measurements	Channel tables	Receiver mode	Code domain power measurements on 3GPP base stations [1]	Power measurements up to 8 GHz/18 GHz	Directional power measurements up to 1 GHz/4 GHz	Measurements on cables (distance-to-fault)	Scalar transmission measurements	Vector transmission measurements [2]	Scalar reflection measurements	Vector reflection measurements [2]	Remote control via RS-232-C interface	One-port cable loss measurements

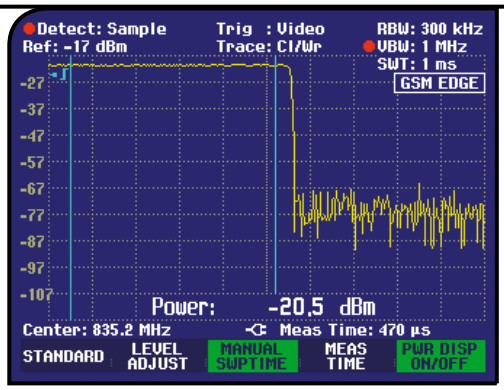
TDMA power measurements

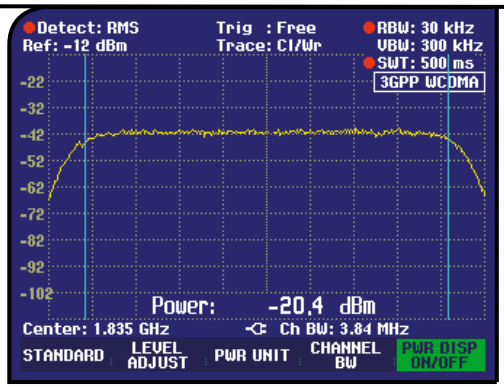
By means of the TDMA POWER function, the R&S®FSH performs time-domain power measurements within a timeslot of TDMA (time division multiple access) methods. All the settings required for the GSM and EDGE standards are predefined on the R&S®FSH to make these measurements easier for the user. In addition, up to five user-definable instrument setups can be loaded into the R&S®FSH using the R&S®FSH View software.

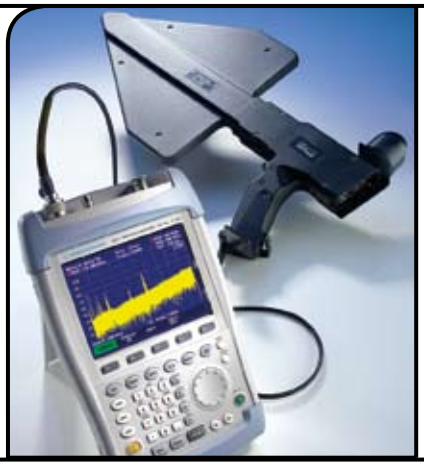


Channel-power measurements

The R&S®FSH determines the power of a definable transmission channel by means of the channel-power measurement function. A channel-power measurement for the digital mobile radio standards 3GPP WCDMA, cdmaOne, and CDMA2000® 1x is performed at a keystroke with all the correct instrument settings. With the R&S®FSHView software, the user can quickly and easily define further standards and load them into the R&S®FSH.

CDMA2000® is a registered trademark of the Telecommunications Industry Association (TIA USA)





Field-strength measurements

When measuring electric field strength, the R&S®FSH takes into account the specific antenna factors of the connected antenna. Field strength is displayed directly in dBµV/m. If W/m^2 is selected, the power flux density is calculated and displayed. In addition, frequency-dependent loss or gain of, for example, a cable or an amplifier can be corrected. For quick and easy result analysis, the R&S®FSH provides two user-definable limit lines with automatic limit monitoring.

R&S®FSH with R&S®HE 200 active directional antenna (optional accessory)

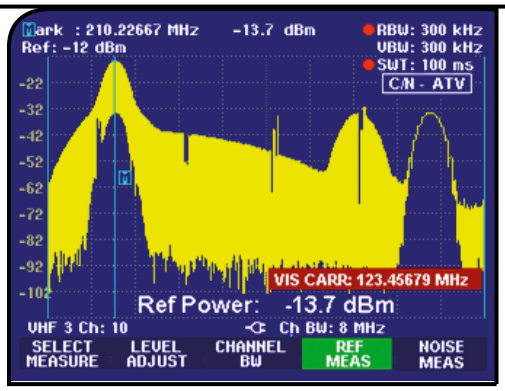
Field-strength measurements with isotropic antenna

When used with the R&S®TS-EMF isotropic antenna, the R&S®FSH can determine the direction-independent resultant field strength in the frequency range from 30 MHz to 3 GHz. For measuring the resultant field strength, the antenna has three orthogonal antenna elements. The R&S®FSH successively triggers the three antenna elements and calculates the resultant field strength. The calculation takes into account the antenna factors for each individual antenna element as well as the cable loss of the connecting cable.

R&S®FSH with R&S®TS-EMF isotropic antenna (optional accessory)

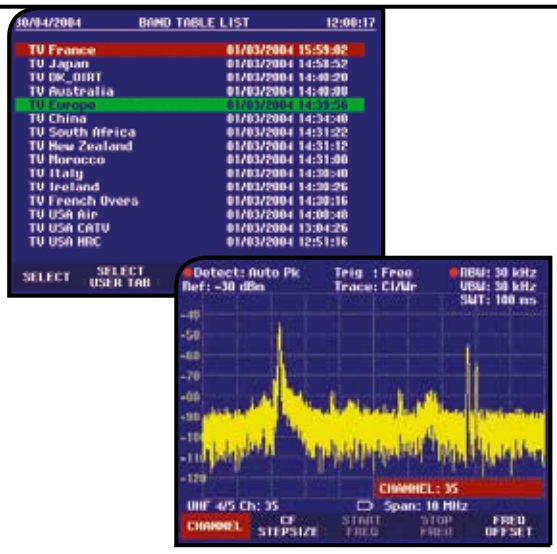
C/N measurements

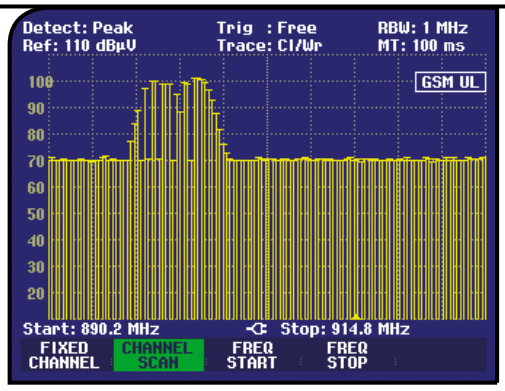
The R&S®FSH offers a carrier/noise (C/N) measurement for determining the ratio of carrier power to noise power or carrier power to noise power density. The R&S®FSH supports three different modes for carrier power measurement. In the CW TX mode, the R&S®FSH determines the power of an unmodulated carrier. In the digital TX mode, it determines the channel power of a reference channel, as is common with digitally modulated carriers (e.g. the DAB, DVB, DVB-T, DVB-H, and J.83/A/B/C standards). Furthermore, the ATSC standard for digital terrestrial television with 8VSB modulation is supported. In the analog TV mode, the R&S®FSH measures the peak power of the vision carrier with amplitude-modulated TV signals.



Channel tables

If preferred, the R&S®FSH can be tuned by channel numbers rather than by entering the frequency. The channel number is displayed instead of the center frequency. Users who are accustomed to channel assignments, which are common in TV and mobile radio applications, can operate the R&S®FSH more easily. The channel tables are generated with the R&S®FSHView software and loaded into the R&S®FSH. The R&S®FSH includes TV channel tables for a number of countries



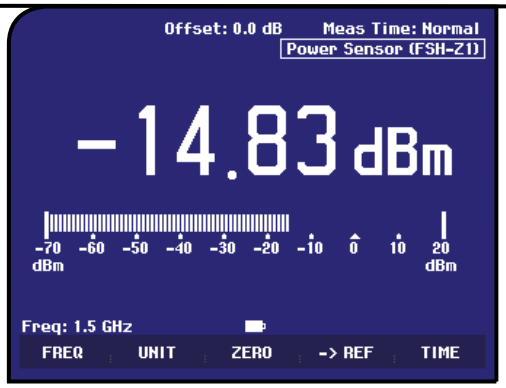


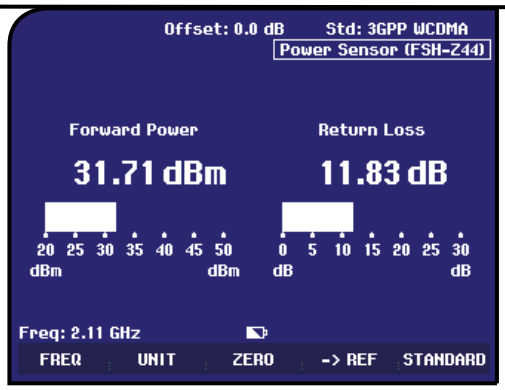
Receiver mode

When equipped with the R&S®FSH-K3 option, the R&S®FSH can be operated as a receiver for monitoring and precompliance EMC applications. Measurements are performed at a predefined frequency with a user-selectable measurement time. In the scan mode, the R&S®FSH sequentially measures each level at various frequencies defined in a channel table. The channel tables are generated with the R&S®FSHView software and loaded into the R&S®FSH. For a few TV transmitter and mobile radio standards, the tables are predefined. In addition, the CISPR bandwidths 200 Hz, 9 kHz, 120 kHz, and 1 MHz are available for EMI emission measurements. The R&S®FSH offers peak, average, RMS, and quasi-peak detectors.

Power measurements

The R&S®FSH-Z1 and R&S®FSH-Z18 power sensors expand the R&S®FSH to a high-precision RF power meter up to 8 GHz and 18 GHz respectively. As with thermal sensors, the true RMS value of the measured signal is obtained over the entire measurement range of –67 dBm to +23 dBm irrespective of the signal waveform. In particular with modulated signals, additional measurement errors can thus be prevented, and handling becomes easy.

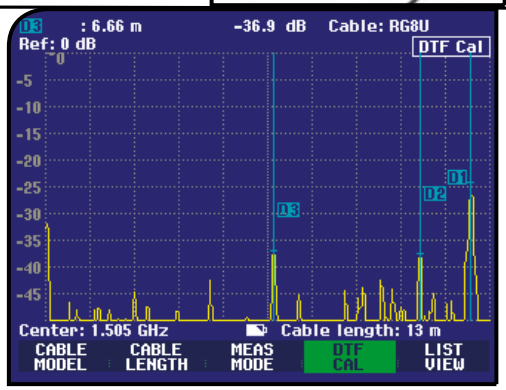




R&S®FSH with R&S®FSH-Z44 directional power sensor

Directional power measurements

The R&S®FSH-Z14 and R&S®FSH-Z44 directional power sensors turn the R&S®FSH into a full-fledged directional power meter with a frequency range of 25 MHz to 1 GHz and 200 MHz to 4 GHz. The R&S®FSH can then simultaneously measure the output power and the matching of transmitter system antennas under operating conditions. The power sensors measure average power up to 120 W and normally eliminate the need for any extra attenuators. They are compatible with the common standards GSM/EDGE, 3GPP WCDMA, cdmaOne, CDMA2000® 1x, DVB-T, and DAB. Additionally, the peak envelope power (PEP) can be determined up to a maximum of 300 W.



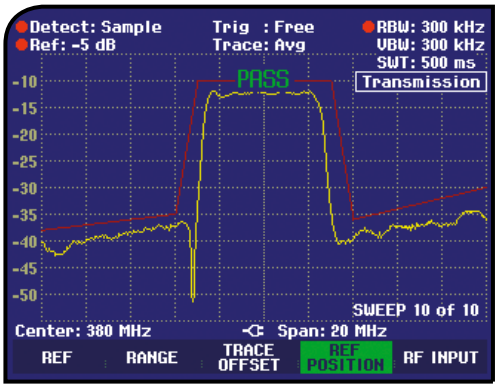
Measurements on cables (distance to fault)

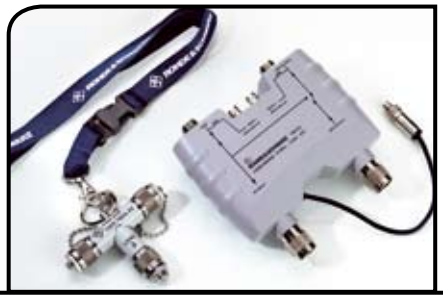
The R&S®FSH-B1 option allows the distance to any faults in an RF cable to be determined rapidly and accurately. Distance-to-fault measurements using the R&S®FSH-Z2/-Z3 VSWR bridge provide an immediate overview of the state of the device under test (return loss and distance, see figure). The marker-zoom function allows detailed analysis of faults with a resolution of up to 1024 pixel.

Only applies to the R&S®FSH with tracking generator and R&S®FSH-B1 (distance-to-fault measurement) and R&S®FSH-Z2/-Z3 (VSWR bridge) options installed

Scalar transmission and reflection measurements with VSWR bridge

The R&S®FSH with built-in tracking generator rapidly determines the transmission characteristics of cables, filters, amplifiers, etc, with a minimum of effort. When equipped with the R&S®FSH-Z2/-Z3 VSWR bridge (10 MHz to 3 GHz/6 GHz), the R&S®FSH can also measure the matching (return loss, reflection coefficient, or VSWR) of an antenna, for example. The bridge is screw-connected directly to the R&S®FSH's RF input and tracking generator output without involving cumbersome, extra cabling. The innovative design of the R&S®FSH-Z3 VSWR bridge with integrated RF bypass switch allows the user to make spectrum and transmission measurements also with the bridge connected. Active components such as amplifiers can be supplied directly via the RF cable by means of the two integrated bias tees.





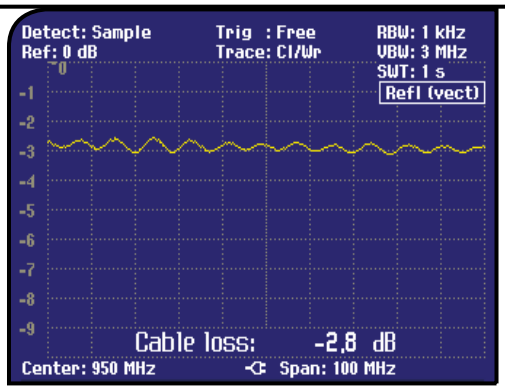
R&S®FSH-Z3 VSWR bridge

Measurement of magnitude and phase in Smith chart

Measurement of phase

Vector transmission and reflection measurements

Compared to scalar transmission and reflection measurements, the R&S®FSH-K2 option offers a significant increase in measurement accuracy and number of measurement functions. In addition to the magnitude of S11 and S21, the phase, group delay, and electrical length of a DUT can be determined. The Smith chart allows simultaneous display of magnitude and phase in order to analyze the matching of an antenna in detail, for example. A user-definable limit line and a zoom function come in handy when evaluating the measurement results. Owing to a wide variety of marker formats, the measured values are displayed in virtually all the conventional formats used in network analysis. The input of a reference impedance permits measurements on DUTs whose impedance is not 50 Ω. To increase measurement accuracy, the R&S®FSH performs complex correction of the system errors after calibration.



One-port cable loss measurements

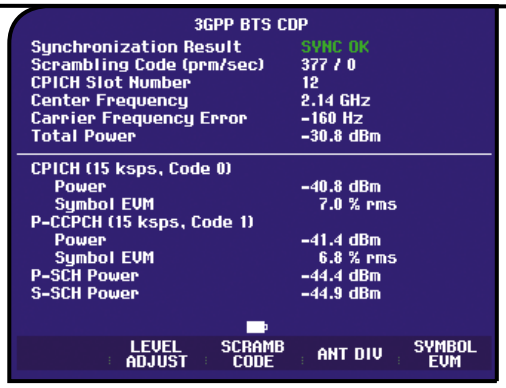
The R&S®FSH with tracking generator and VSWR bridge can determine the cable loss of previously installed long cables without much effort. One end of the cable is connected to the VSWR bridge, and the other end is terminated with a short circuit or simply left open. The calculated cable loss represents the average value within the displayed frequency range. The loss at specific frequencies is determined via markers. The one-port cable loss measurement is only available with the R&S®FSH-K2 option.

3GPP FDD code domain power measurements on base stations

The R&S®FSH-K4 option[1)] allows code domain power measurements on a 3GPP base station. It measures the total power and the power of the most important code channels, such as the common pilot channel (CPICH), primary common control physical channel (P-CCPCH), primary synchronization channel (P-SCH), and secondary synchronization channel (S-SCH). Furthermore, the carrier frequency offset and the error vector magnitude (EVM) are measured and displayed. The scrambling code can be determined at the press of a button and used automatically for decoding the code channels. The user can also get a quick overview of adjacent base stations. The R&S®FSH can display up to eight scrambling codes with their CPICH power. The R&S®FSH-K4 option provides automatic level setting for fast and optimal setting of the reference level. In practice, this means very easy operation. To display the code domain power measurement values, only four operating steps are necessary:

- Select the 3GPP CDP function
- Set the center frequency
- Use "Level Adjust" to optimize the level setting
- Start the scrambling code search

For base stations with two antennas, the user can select which antenna the R&S®FSH should synchronize to (antenna diversity).



[1)] Available for the R&S®FSH3 (model .23) with serial number 103500 or later.

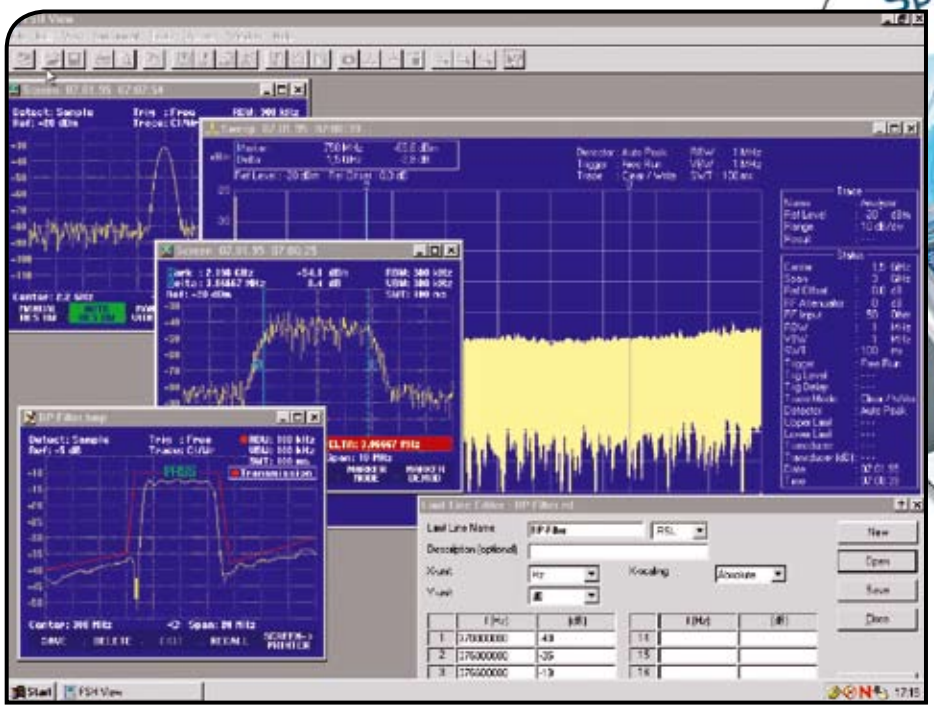
Locating EMC weak spots

The R&S®HZ-15 near-field probe set is a diagnostic tool for locating EMC weak spots on printed boards, integrated circuits, cables, shieldings, and other trouble spots. The R&S®HZ-15 near-field probe set can handle emission measurements from 30 MHz to 3 GHz. Its sensitivity can be enhanced by adding the R&S®HZ-16 preamplifier, which has a frequency range of up to 3 GHz, a gain of approx. 20 dB, and a noise figure of 4.5 dB. In combination with the R&S®FSH, the preamplifier and near-field probe set are a cost-effective means of analyzing and locating sources of interference during development.

R&S®FSH with near-field probe set and DUT

R&S®FSH View Control Software

The powerful software package for documenting your measurements is supplied with every R&S®FSH.



Features

- Runs under Windows 98/ME/NT/2000/XP
- Rapid and simple transfer of measurement data from the R&S®FSH to a PC and vice versa
- Data export in ASCII or MS Excel format
- Printout of all relevant data via Windows (screenshot of the R&S®FSH display for documentation)
- Graphics data stored in standard formats (.bmp, .pcx, .png, .wmf)
- Permanent and continuous transfer of sweeps to the PC; facilities for subsequent analysis (markers, zoom, etc)
- Storage space for traces and measurement data, as well as for comparisons of current and previous measurements (available space is limited only by the size of the hard disk of the controlling PC)
- Automatic storage of measurement results at selectable intervals
- Generation of cable data with a built-in cable editor; downloading to the R&S®FSH for distance-to-fault measurements (R&S®FSH-B1)
- Editor for generating limit lines, user-definable standards (measurement of occupied bandwidth, channel power, and TDMA power), transducer factors, and correction factors for taking into account external attenuators or amplifiers, as well as channel lists
- Macro function for Word for fast and easy documentation of measurement results
- Connection between PC and R&S®FSH via interference-free, RS-232-C optical interface

Specifications

Specifications apply under the following conditions: 15 minutes warm-up time at ambient temperature, specified environmental conditions met, and calibration cycle adhered to. Data without tolerances: typical values. Data designated as "nominal": design parameters, i. e. not tested.

		R&S®FSH3	R&S®FSH6	R&S®FSH18
